

Known Bugs:

Description:

The system correctly identifies "Cold Start" scenarios for new users and generates a fallback list of popular movies. However, this list is sorted in Ascending Order (Lowest Rated -> Highest Rated) instead of the required Descending Order (Highest Rated -> Lowest Rated). This results in lower-rated movies appearing as the "top" recommendations.

Reproduction Steps:

1. Ensure the data/my_ratings.txt file is empty or non-existent to simulate a new user.
2. Launch the application or run the manual test suite RecommendationSystemTest.
3. Select the option to "Get Movie Recommendations" (or observe TEST 1 output).
4. Review the rating values of the top 3 recommended movies.

Expected vs. Actual Behavior:

- **Expected:** The list starts with the highest-rated movies (e.g., *The Godfather*, 4.8) and descends.
- **Actual:** The list starts with lower-rated movies (e.g., *The Terminator*, 4.3) and ascends to higher ratings at the bottom.

Proposed Fix:

The source code logic for the Comparator in DataManager.java appears mathematically correct for descending order. The issue is likely caused by a stale build artifact (running old .class files).

- **Action:** Perform a "Clean and Rebuild" of the project: delete all .class files in src/ and testing/, then recompile using javac.
